## Portfolio Description

The DFA International Value Portfolio is a disciplined and broadly diversified vehicle designed to capture the risk factors research has shown generate higher expected returns over time. Dimensional employs an investment process that focuses on capturing these premiums in ways that minimize turnover and trading costs, manage market frictions and mitigate the adverse effects of momentum through flexible and patient trading. The portfolio invests in large non-US developed market equity securities assessed by market capitalization within each market. Value screens are also applied to focus the portfolio on deeper value stocks as measured primarily by book-to-market ratio. All potential holdings pass through additional rigorous screens to place more emphasis on the desired asset class and to exclude securities that present a potential drag on performance.

## Quarterly Report

**Quarter Ending**  
September 30, 2013

**Portfolio:**  
Intl. Value Portfolio (I) vs. MSCI World ex USA Index (net div.)

## Performance Commentary

### Market Overview

In US dollar terms, developed non-US markets had excellent aggregate returns, especially in September, and led the broad US market and emerging markets. Performance in continental Europe was particularly strong, as the recession ended in the eurozone and tentative economic growth resumed across the continent. Returns, as measured by the MSCI World ex USA IMI Index (net dividends), were 11.8%.

As in most of the previous quarters, dispersion at the individual country level remained elevated. For instance, the difference between the best-performing developed market, Greece (which is being reclassified by the MSCI benchmarks as an emerging market in November 2013), and the worst-performing one, Israel, was more than 21% (26.3% vs. 4.8%). The US dollar strongly depreciated against all major currencies. As a result, currency fluctuations had a positive impact of 3.9% on the dollar-denominated returns of developed non-US equities. Telecommunications services and industrials were the strongest-performing sectors, while healthcare and REITs were the weakest.

### Premium Discussion

Along the size dimension, conventional indices indicated a positive size premium as the MSCI World ex US Small Cap Index outperformed its large cap peer. While performance was positive across the market capitalization segments, mega caps (stocks with a market value over \$50B) posted the weakest relative returns. The trend of small caps outperforming large was consistent across regions, and was especially strong in Japan and the UK.

Along the relative price dimension, low relative price (value) stocks outperformed high relative price (growth) stocks across all market capitalization segments. However, a closer look reveals that the value premium was less pronounced among small cap stocks. In addition, large cap growth stocks posted the weakest absolute returns across the market capitalization and style spectrums. At the regional level, UK/Ireland and Japan went against overall trends in the marketplace. In UK/Ireland, deep value stocks underperformed the other segments of the style spectrum, while Japan experienced strong performance at both ends of the style spectrum and weaker relative performance among neutral stocks.

### Attribution Description

Detailed attribution for your particular strategy can be found in the charts on the following pages. These tables contrast the portfolios exposure to various factors (e.g., size, value, sector, region, and country) against a stated benchmark. Attribution by Size is broken down in to market cap ranges i.e., the largest stocks are included in the top bucket and the smallest names are captured in the bottom bucket. Attribution by Price-to-Book (value vs. growth) breaks its observations down into quartiles and includes growth-oriented stocks (highest P/B) in the top bucket and value stocks (lowest P/B) in the bottom bucket. The Attribution by Sector table breaks down the portfolio performance relative to the benchmark by sector, as defined by GICS (with the exception of REITs). Finally, attributions are broken down by region and individual emerging market country exposure.

**Quarterly Report**

**Quarter Ending**  
September 30, 2013

**Portfolio:**  
Intl. Value Portfolio (I) vs. MSCI World ex USA Index (net div.)

## Attribution Definition

**Portfolio Allocation:** Measures the weighting differences between the portfolio and benchmark amongst the different buckets. Generally speaking, if the portfolio has greater (lesser) weight in a particular bucket than the benchmark and that segment for the benchmark outperforms the overall benchmark return, there will be positive (negative) attribution.

**Portfolio Composition:** Measures the underlying returns based on the composition of the assets held within each segment of the attribution chart. If, for example, the benchmark and portfolio weights in a particular size quintile were identical, but the underlying composition of the stocks held within that bucket was different, there would be different return results. More generally, if the portfolio's composition of securities within a particular bucket results in higher (lower) returns than the benchmark's composition, attribution results for that bucket would be positive (negative).

**Interaction component:** This component of attribution arises because returns compound the wealth in a portfolio grows multiplicatively, not additively. Thus, a difference between the portfolio and benchmark returns in one period causes a difference in their dollar growth their growth of wealth in all future periods. The Interaction Component captures this compounding effect which occurs over multiple time periods. Over more volatile periods, this number can at times be inflated.

**Additional Notes:** From time to time strategy attributions may appear to have inconsistent results. Some causes for potential divergence include:

-When the portfolio or benchmark has a very small allocation to a bucket and the return of the holding(s) in that bucket is extreme (e.g. if the index has a 1% allocation to a bucket with a 102% return and the portfolio has a 10% allocation and a 10% return), the allocation and composition contributions in this situation can become exaggerated.

-The return of the benchmark may not be indicative of the actual return because there is no weight (or only a few names). For example, in DFA's international small cap portfolio compared to the MSCI EAFE small cap benchmark, the portfolio invests in Canada while the benchmark does not. Therefore, the benchmark attribution components would utilize a 0% weight and a null return for Canada which would most likely lead to misleading results.

-Since attributions are computed on a month over month basis, during periods of extreme volatility, attribution results may be inconsistent with the average weights and returns shown in the buckets. The linked tables may in some cases show opposite contributions to what one would expect from the overall weights and returns allocation.

-'Other' Category: The 'Other' category at the bottom of the attribution charts can at times be larger than expected as it constitutes various items including differences owing to timing of foreign exchange rates, pricing methodology, trading, turnover, and other items.
